## DEPARTMENT OF ELECTRONICS AND TELECOMMUNICATION ENGINEERING

### ABOUT THE DEPARTMENT

The Department of Electronics and Telecommunication Engineering is one of the leading departments of Arvind Gavali College of Engineering. The department is equipped with qualified and experienced faculty members, modern laboratories, advanced computing facilities, and research-oriented infrastructure to support quality education and innovation.

The department is committed to providing quality technical education and fostering excellence in teaching, research, and professional development. Keeping pace with rapid technological advancements and the growing demand for specialized professionals, the department is pleased to introduce a Postgraduate (PG) Program in Electronics and Telecommunication Engineering from the academic year 2026–27.

The postgraduate program will focus on emerging areas of Electronics and Communication Engineering, including Advanced Communication Systems, RF and Microwave Engineering, Embedded Systems, VLSI Design, Signal Processing, Internet of Things (IoT), Artificial Intelligence, and Next-Generation Wireless Networks. The curriculum is designed to meet the evolving requirements of industry, research organizations, and academia.

The department emphasizes outcome-based education, industry interaction, interdisciplinary research, innovation, entrepreneurship, and lifelong learning. Through projects, internships, industrial visits, workshops, seminars, and research activities, students develop analytical, technical, and professional competencies required to address complex engineering challenges.

The department strives to produce competent engineers, researchers, innovators, and technology leaders capable of contributing effectively to society and technological advancement.

#### **Vision Statement:**

*"Empowering Innovation through Advanced Electronics and Communication Technologies."*

The newly introduced PG program aims to create opportunities for advanced learning, research, and skill development, enabling graduates to contribute significantly to technological progress, industrial growth, and societal development.

## DEPARTMENT VISION

To be a premier postgraduate programme in Electronics and Telecommunication Engineering that develops competent researchers, innovators, and technology leaders capable of providing sustainable solutions to industrial and societal challenges.

## DEPARTMENT MISSION

|           |                                                                                                                                                                                                    |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>M1</b> | To impart advanced knowledge and research-oriented education in Electronics and Telecommunication Engineering through effective teaching-learning processes and modern technological tools.        |
| <b>M2</b> | To nurture innovation, analytical thinking, professional competence, and multidisciplinary skills required for solving complex engineering problems and contributing to technological advancement. |
| <b>M3</b> | To inculcate ethical values, environmental consciousness, lifelong learning, and social responsibility among graduates for sustainable development and nation building.                            |

## PROGRAM EDUCATIONAL OBJECTIVES (PEO)

|              |                                                                                                                                                                                               |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>PEO 1</b> | Graduates will apply advanced concepts of Electronics and Telecommunication Engineering to analyze, design, and develop innovative solutions for industrial, societal, and research problems. |
| <b>PEO 2</b> | Graduates will apply advanced concepts of Electronics and Telecommunication Engineering to analyze, design, and develop innovative solutions for industrial, societal, and research problems. |
| <b>PEO 3</b> | Graduates will engage in lifelong learning, research, innovation, entrepreneurship, and ethical professional practices while contributing to society and sustainable development.             |

## PROGRAM OUTCOMES (PO)

|             |                                                                                                                                                                                           |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>PO 1</b> | Ability to demonstrate advanced knowledge and mastery in the area of Electronics and Telecommunication Engineering at a level higher than that of an undergraduate engineering programme. |
| <b>PO 2</b> | Ability to independently carry out research, investigation, and development work to solve complex engineering problems.                                                                   |

|             |                                                                                                                                                                                                         |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>PO 3</b> | Ability to effectively write, publish, and present technical reports, research papers, patents, and project outcomes.                                                                                   |
| <b>PO 4</b> | Ability to analyze, design, and develop innovative solutions for complex engineering and societal problems.                                                                                             |
| <b>PO 5</b> | Ability to apply modern engineering tools, simulation software, and experimental techniques for modelling, analysis, validation, and optimization of engineering systems.                               |
| <b>PO 6</b> | An ability to demonstrate professional ethics, leadership, teamwork, environmental consciousness, and a commitment to lifelong learning for sustainable technological development and societal welfare. |

### PROGRAM SPECIFIC OUTCOMES (PSO)

|              |                                                                                                                                                                                                                                                                          |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>PSO 1</b> | Graduates will be able to analyze, model, design, and optimize advanced Electronics and Telecommunication systems in both the fundamental and emerging technologies.                                                                                                     |
| <b>PSO 2</b> | Graduates will be able to undertake research, innovation, and product development activities by effectively utilizing modern engineering tools, simulation platforms, programming environments, and experimental methodologies to address industrial and societal needs. |

|              | <b>PO 1</b> | <b>PO 2</b> | <b>PO 3</b> | <b>PO 4</b> | <b>PO 5</b> | <b>PO 6</b> |
|--------------|-------------|-------------|-------------|-------------|-------------|-------------|
| <b>PEO 1</b> | 3           | 3           | 3           | 2           | 3           | 2           |
| <b>PEO 2</b> | 2           | 2           | 2           | 3           | 2           | 1           |
| <b>PEO 3</b> | 1           | 1           | 1           | 2           | 1           | 3           |

### MAPPING OF PEO's TO PSO's

|              | <b>PSO 1</b> | <b>PSO2</b> |
|--------------|--------------|-------------|
| <b>PEO 1</b> | 3            | 2           |
| <b>PEO 2</b> | 3            | 3           |
| <b>PEO 3</b> | 1            | 3           |

### Course Pre-Requisites:

Students should possess the following prerequisite knowledge:

#### 1. Engineering Mathematics

- Probability and basic statistics
- Matrix algebra and linear algebra fundamentals
- Differential and integral calculus
- Multivariable functions and partial differentiation
- Infinite series and convergence concepts

#### 2. Signals and Systems

- Continuous-time and discrete-time signals
- System properties and classifications
- Convolution and correlation
- Fourier Series and Fourier Transform
- Power and energy spectral concepts

#### 3. Digital Signal Processing Fundamentals

- Sampling theorem
- Random signal representation
- Discrete Fourier Transform (DFT) and Fast Fourier Transform (FFT)
- Spectral analysis basics
- Digital filtering concepts

#### 4. Communication Engineering

- Communication system fundamentals
- Noise in communication systems
- Signal transmission through channels
- Detection and estimation concepts in communication receivers
- Analog and digital communication basics

#### 5. Probability and Statistics

- Random experiments and sample spaces
- Probability distributions
- Conditional probability and Bayes' theorem
- Mean, variance, covariance, and correlation
- Statistical inference fundamentals

#### 6. Programming and Computational Tools

- Basic MATLAB/Python programming
- Numerical computation and visualization
- Data analysis and simulation fundamentals

### Course Description:

Signal Theory and Estimation Techniques provides a comprehensive study of the mathematical and statistical foundations required for modeling, analyzing, and processing signals in the presence of uncertainty. The course introduces probability theory, random variables, and stochastic processes as essential tools for representing and analyzing random phenomena encountered in modern engineering systems. Students develop a strong understanding of statistical characterization, transformations of random variables, correlation

analysis, spectral representations, and random signal modeling techniques.

The course further explores the principles of estimation theory and optimal filtering, including Maximum Likelihood Estimation (MLE), Maximum A Posteriori (MAP) estimation, Bayesian estimation, Minimum Mean Square Error (MMSE) estimation, Wiener filtering, and Kalman filtering. These techniques enable the extraction of useful information from noisy observations and form the basis of modern signal processing, communication, and control systems.

Advanced topics in detection theory and statistical signal processing are also covered, including hypothesis testing, Neyman-Pearson detection, likelihood ratio tests, matched filtering, adaptive estimation, and Bayesian decision theory. The course emphasizes practical applications in wireless communications, radar and sonar systems, biomedical signal processing, speech and audio processing, intelligent sensing systems, and emerging AI-enabled signal analytics.

By the end of the course, students will be able to model random signals and systems, design optimal estimators and detectors, and apply statistical signal processing techniques to solve complex engineering problems involving uncertainty, noise, and decision-making. The course serves as a foundation for advanced studies and research in statistical signal processing, machine learning for signal analysis, communication engineering, radar systems, and intelligent sensing technologies.

### Course Objectives:

1. Develop a strong foundation in probability theory, random variables, and probability distributions for modeling uncertainty in engineering systems.
2. Understand the statistical characterization and transformation of random variables using moments, correlation measures, characteristic functions, and convergence concepts.
3. Analyze stochastic processes and random signal models using correlation functions, spectral analysis, stationarity, ergodicity, and Markov processes.
4. Apply estimation theory and optimal filtering techniques, including MLE, MAP, Bayesian estimation, MMSE estimation, Wiener filtering, and Kalman filtering, to estimate unknown parameters and states from noisy observations.
5. Develop the ability to apply detection theory and statistical signal processing techniques for solving problems in wireless communications, radar, biomedical systems, intelligent sensing, and AI-enabled signal analysis.

### Course Outcomes:

| CO  | After the completion of the course the student should be able to:                                                                                                        |
|-----|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CO1 | Apply probability theory, random variable concepts, probability distributions, and Bayesian principles to model and analyze engineering systems affected by uncertainty. |
| CO2 | Analyze statistical characteristics and transformations of random variables using moments, correlation measures, characteristic functions, and convergence concepts.     |

|            |                                                                                                                                                                                                                                          |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>CO3</b> | Analyze stochastic processes and random signal models using stationarity, ergodicity, correlation functions, spectral analysis, and Markov processes for communication and signal processing applications.                               |
| <b>CO4</b> | Evaluate estimation techniques and optimal filtering methods, including MLE, MAP, Bayesian estimation, MMSE estimation, Wiener filtering, and Kalman filtering for parameter and state estimation problems.                              |
| <b>CO5</b> | Apply detection theory and statistical signal processing techniques to solve signal detection, classification, and decision-making problems in wireless communications, radar, biomedical systems, and intelligent sensing applications. |

### CO-PO Mapping:

| CO         | PO1 | PO2 | PO3 | PO4 | PO5 | PO6 | PSO1 | PSO2 |
|------------|-----|-----|-----|-----|-----|-----|------|------|
| <b>CO1</b> | 3   | 2   | -   | 2   | 1   | -   | 3    | 1    |
| <b>CO2</b> | 3   | 3   | -   | 2   | 2   | -   | 3    | 1    |
| <b>CO3</b> | 3   | 3   | -   | 3   | 2   | -   | 3    | 2    |
| <b>CO4</b> | 3   | 3   | 1   | 3   | 3   | -   | 3    | 3    |
| <b>CO5</b> | 3   | 3   | 2   | 3   | 3   | 1   | 3    | 3    |

### Assessment Scheme:

Two components of Continuous Assessment (CA-1, CA-2), Mid Semester Examination (MSE) and End Semester Examination (ESE) having 20%, 30% and 50% weightage respectively.

| Assessment Component | Marks |
|----------------------|-------|
| CA1                  | 15    |
| MSE                  | 20    |
| CA2                  | 15    |
| ESE                  | 50    |

**CA1** and **CA2** are based on Assignment/ Declared test/ Quiz/Seminar/Group discussions presentation, etc.

**MSE** is based on 50% of course content.

**ESE** is based on 100% course content with 60-70% weightage for course content covered after MSE

**Course Pre-Requisite:** Engineering Mathematics III, Digital Signal Processing, Digital Image Processing

**Course Description:** This course aims to focus on applications of Image and Video Processing. It includes the concepts based upon Image enhancement, moving object detection, video compression etc.

**Course Objectives:**

1. Develop an understanding of advanced image enhancement and preprocessing techniques for improving image quality and facilitating further image analysis.
2. Acquire knowledge of image segmentation, feature extraction, and object recognition techniques for interpreting and analyzing visual information.
3. Understand the principles and applications of video processing, motion analysis, and video compression standards used in multimedia systems.
4. Apply modern image and video processing algorithms, computational methods, and software tools for solving real-world computer vision problems.
5. Analyze advanced video analytics techniques such as motion estimation, object tracking, activity recognition, and intelligent video surveillance applications.

**Course Outcomes:**

| CO  | After the completion of the course the student should be able to                                                                                                        |
|-----|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CO1 | Apply image enhancement techniques for improving image quality and preparing images for further analysis.                                                               |
| CO2 | Analyze image segmentation and feature extraction methods for identifying and interpreting meaningful image regions and objects.                                        |
| CO3 | Evaluate object recognition and classification techniques using statistical, pattern recognition, and machine learning approaches.                                      |
| CO4 | Apply video processing and compression techniques for efficient video representation, storage, transmission, and analysis.                                              |
| CO5 | Analyze advanced video processing techniques such as motion estimation, object tracking, activity recognition, and video analytics for intelligent vision applications. |

**CO-PO Mapping:**

| CO  | PO1 | PO2 | PO3 | PO4 | PO5 | PO6 | PSO1 | PSO2 |
|-----|-----|-----|-----|-----|-----|-----|------|------|
| CO1 | 3   | 1   | -   | 2   | 3   | -   | 3    | 2    |
| CO2 | 3   | 2   | -   | 3   | 3   | -   | 3    | 2    |
| CO3 | 3   | 2   | 1   | 3   | 2   | -   | 3    | 3    |

### Course Prerequisite:

The following prerequisites are needed:

1. Fundamentals of Engineering Mathematics
  - Linear Algebra
  - Probability and Statistics
  - Matrices and Vector Spaces
2. Basics of Quantum Mechanics
  - Wave-particle duality
  - Quantum states and superposition
3. Fundamentals of Artificial Intelligence and Machine Learning
  - Neural Networks
  - Supervised and Unsupervised Learning
  - Optimization Techniques
4. Knowledge of Algorithms and Data Structures
  - Searching and optimization algorithms
  - Computational complexity basics
5. Basic Programming Skills
  - Python/C/C++ programming
  - Logical problem-solving
6. Fundamentals of Computer Architecture and Computing Systems
  - Classical computing concepts
  - Binary systems and logic gates

These prerequisites are suitable because the subject combines concepts from quantum computing, artificial intelligence, machine learning, cryptography, and optimization algorithms.

### Course Description:

This course introduces the fundamental concepts of quantum technology, quantum computing, and Quantum Artificial Intelligence (Quantum AI) with emphasis on quantum algorithms and their applications in intelligent systems. The course covers the principles of quantum mechanics, differences between classical and quantum computing, and important quantum computing methods such as quantum cryptography, quantum error correction, and major quantum algorithms including Simon's, Shor's, and Grover's algorithms.

The course further explores the integration of quantum computing with artificial intelligence through Quantum Neural Networks, Quantum Machine Learning techniques, and hybrid quantum-classical models. It also discusses the advantages, challenges, and practical implementation aspects of Quantum AI systems.

In addition, the course focuses on real-world applications of Quantum AI in optimization problems, scientific simulations, drug discovery, cybersecurity, and data protection. The subject enables students to understand emerging trends in quantum computing and prepares

them for advanced research and industrial applications in Quantum AI and intelligent computing systems.

**Course Objectives:**

- To introduce the fundamental principles of quantum mechanics, quantum technology, and quantum computing along with their applications and comparison with classical computing systems.
- To understand important quantum computing methods, quantum cryptography, quantum error correction techniques, and major quantum algorithms used in secure and high-speed computation.
- To explain the concepts of Quantum AI and Quantum Neural Networks and understand the transition from classical AI systems to Quantum AI systems using quantum algorithms.
- To study Quantum Machine Learning methods, quantum data representation, and hybrid quantum-classical learning models for intelligent computing applications.
- To analyze the applications of Quantum AI in optimization, scientific simulations, drug discovery, cybersecurity, and advanced intelligent systems.

**Course Outcomes:**

| CO  | After the completion of the course the student should be able to                                                                                                                                                     |
|-----|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CO1 | Explain the principles of quantum technology and quantum computing, differentiate between classical and quantum computing systems, and identify major applications of quantum computing.                             |
| CO2 | Analyze quantum computing methods, explain quantum cryptography and error correction techniques, and understand the working principles of major quantum algorithms such as Simon's, Shor's, and Grover's algorithms. |
| CO3 | Explain Quantum AI concepts, analyze Quantum Neural Networks, and evaluate the role of quantum algorithms in enhancing artificial intelligence systems.                                                              |
| CO4 | Apply Quantum Machine Learning concepts, analyze hybrid quantum-classical learning models, and understand quantum learning techniques for intelligent data processing.                                               |
| CO5 | Analyze and explain the applications of Quantum AI in optimization problems, scientific simulations, drug discovery, cybersecurity, and data protection systems.                                                     |

**CO-PO Mapping:**

### Course Pre-requisite:

- Before studying Electromagnetic Interference and Compatibility (EMI/EMC), students should have basic knowledge of the following subjects and concepts:
- Engineering Physics - Fundamentals of electromagnetic fields and waves, Electric and magnetic field concepts
- Network Theory / Circuit Theory - RLC circuits, Frequency response and resonance, Transmission line basics
- Signals and Systems - Time and frequency domain representation, Fourier analysis concepts
- Analog and Digital Electronics - Electronic components and circuits, Switching characteristics and noise sources
- Electromagnetic Fields and Waves - Maxwell's equations, Wave propagation, Radiation and antenna fundamentals
- Communication Engineering Basics - Radio communication systems, Signal transmission and reception
- Basic Mathematics - Differential equations, Probability and statistics fundamentals
- Computer Simulation Fundamentals - Basic exposure to simulation/software tools used in electronics and communication engineering

### Course Description:

The course Electromagnetic Interference and Compatibility (EMI/EMC) provides comprehensive knowledge of electromagnetic interference phenomena, compatibility requirements, and mitigation techniques used in modern electronic and communication systems. The course introduces the fundamentals of EMI generation, coupling mechanisms, electromagnetic standards, and the behavior of radiated and conducted emissions in electronic equipment.

The course covers EMI measurement techniques, including radiated and conducted interference testing, open area test sites, and immunity evaluation methods used for compliance with international EMC standards. It also emphasizes practical EMI reduction techniques such as grounding, shielding, bonding, filtering, and suppression methods for improving system performance and reliability.

Advanced topics including probabilistic and statistical EMI/EMC models, electromagnetic compatibility in communication systems, computer-based EMI modeling, and signal integrity analysis are incorporated to address present-day industrial and research requirements. The course enables students to understand EMC challenges in high-speed electronic systems, wireless communication devices, and embedded systems.

The knowledge gained through this course helps students develop the ability to analyze electromagnetic compatibility issues, design EMI-resilient systems, and apply appropriate

EMC standards and mitigation strategies in real-world electronic product development and communication applications.

### Course Objectives:

- Understand the fundamental concepts of electromagnetic interference, electromagnetic compatibility, EMI sources, coupling mechanisms, and EMC standards.
- Explain radiated and conducted interference phenomena along with EMI measurement techniques and compliance testing procedures.
- Apply grounding, shielding, bonding, filtering, and other EMI suppression techniques for minimizing electromagnetic interference in electronic systems.
- Analyze probabilistic and statistical EMI/EMC models and evaluate electromagnetic compatibility issues in communication systems.
- Develop the ability to use computer-based EMI modeling and signal integrity concepts for the design and analysis of modern electronic and communication systems.

### Course Outcomes:

| CO  | After the completion of the course the student should be able to                                                                              |
|-----|-----------------------------------------------------------------------------------------------------------------------------------------------|
| CO1 | Explain the fundamentals of electromagnetic interference, electromagnetic compatibility, EMI sources, coupling mechanisms, and EMC standards. |
| CO2 | Demonstrate the principles of radiated and conducted EMI measurements and interpret interference and immunity testing procedures.             |
| CO3 | Apply grounding, shielding, bonding, and filtering techniques to reduce electromagnetic interference in electronic systems.                   |
| CO4 | Analyze probabilistic and statistical EMI/EMC models and evaluate EMC issues in terrestrial communication systems.                            |
| CO5 | Use computer-based EMI modeling and signal integrity concepts for the analysis and design of electromagnetic compatible electronic systems.   |

**Course pre-requisite:**

Before studying Signal Processing Algorithms and Applications, students should have knowledge of the following subjects and concepts:

**1. Signals and Systems**

- Continuous-time and discrete-time signals
- Linear Time Invariant (LTI) systems
- Convolution and correlation
- Fourier series and Fourier transforms
- Sampling theorem

**2. Digital Signal Processing**

- Discrete Fourier Transform (DFT) and Fast Fourier Transform (FFT)
- Z-transform and its properties
- FIR and IIR digital filters
- Frequency response analysis
- Filter realization structures

**3. Engineering Mathematics**

- Linear algebra and matrices
- Complex numbers and complex analysis
- Probability and random processes
- Differential and difference equations
- Numerical methods and optimization basics

**4. Communication Systems**

- Basics of analog and digital communication
- Modulation and demodulation techniques
- Noise and spectral analysis

**5. Programming and Computational Skills**

- MATLAB/Python programming for signal processing
- Basic algorithm development
- Numerical computation techniques

**6. Transforms and Applied Mathematics**

- Laplace Transform
- Fourier Transform
- Z-Transform
- Orthogonal functions and vector spaces

These pre-requisites help students understand advanced DSP algorithms, multirate signal processing, adaptive filtering, wavelet transforms, and modern signal processing applications effectively.

**Course Description:**

This course provides an in-depth understanding of advanced digital signal processing algorithms and their practical applications in modern engineering systems. The course covers transform-domain analysis of discrete-time signals and systems, digital filtering techniques, realization structures, and efficient computational algorithms for signal processing operations.

The course emphasizes the design and analysis of FIR and IIR digital filters, multirate signal processing techniques, filter banks, and spectral transformation methods. It also introduces advanced concepts such as orthogonal signal representation, adaptive filtering, wavelet transform, multiresolution analysis, and power spectrum estimation.

The subject focuses on developing analytical and implementation skills required for solving real-world problems in communication systems, biomedical signal processing, multimedia systems, radar, speech processing, image processing, and embedded DSP applications. The course bridges theoretical DSP concepts with modern computational approaches and industry-oriented applications using contemporary signal processing algorithms.

**Course Objectives:**

- To understand transform-domain analysis, filtering techniques, and computational algorithms used in digital signal processing systems.
- To analyze and implement discrete-time systems and various digital filter realization structures for signal processing applications.
- To design FIR and IIR digital filters using transformation and optimization techniques for practical DSP applications.
- To understand multirate signal processing concepts and analyze filter bank structures used in modern communication and multimedia systems.
- To study advanced signal representation, adaptive filtering, and spectral estimation techniques for intelligent signal processing applications.

**Course Outcomes:**

| CO  | After the completion of the course the student should be able to                                                                                        |
|-----|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| CO1 | Analyze discrete-time signals and systems using transform-domain techniques and computational DSP algorithms.                                           |
| CO2 | Implement and evaluate various digital filter structures and discrete-time system realizations for signal processing applications.                      |
| CO3 | Design FIR and IIR digital filters using appropriate transformation and optimization methods.                                                           |
| CO4 | Apply multirate signal processing techniques and filter bank structures in modern communication and multimedia systems.                                 |
| CO5 | Analyze advanced signal processing methods including wavelet transforms, adaptive filtering, signal representation, and spectral estimation techniques. |

| <b>Title of the Course:</b> Analog and Mixed Signal Processing | <b>L</b> | <b>T</b>  | <b>P</b> | <b>Credit</b> |
| <b>Course Code:</b> 26ETC11034                                 | <b>3</b> | <b>--</b> | <b>-</b> | <b>3</b>      |

**Course pre-requisite:** Students should be comfortable with analog circuits, signals & systems, control theory, and basic IC design concepts before taking this course.

**Course Description:** This course covers the fundamentals and design of analog and mixed-signal systems, including switched capacitor circuits, ADCs, DACs, and PLL/DLL-based frequency synthesis. It emphasizes performance analysis, non-idealities, and low-power design techniques, with applications in VLSI, communication, and embedded systems.

**Course Objectives:**

1. Develop a deep understanding of analog, discrete-time, and mixed-signal systems.
2. Design and analyze switched capacitor circuits, high-performance data converters (ADC/DAC), and PLL/frequency synthesis systems.
3. Explore non-idealities, optimization techniques, and low-power (green) design approaches.
4. Apply the concepts to modern VLSI, communication, and embedded system applications.

**Course Outcomes:**

| <b>CO</b>  | <b>After the completion of the course the student should be able to</b>                                                                                                       |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>CO1</b> | Analyze Analog and discrete-time signal processing systems.                                                                                                                   |
| <b>CO2</b> | Design switched capacitor filters and amplifiers, considering non-ideal effects.                                                                                              |
| <b>CO3</b> | Evaluate and design high-performance ADCs and DACs.                                                                                                                           |
| <b>CO4</b> | Analyze and design Analog/Digital PLLs and DLLs, and optimize circuits for low power, high speed, and high resolution, with application to real-world mixed-signal IC design. |
| <b>CO5</b> |                                                                                                                                                                               |

| <b>CO3</b> | 3          | 3          | -          | 3          | 3          | -          | 3           | 2           |
| <b>CO4</b> | 3          | 3          | 1          | 3          | 3          | 1          | 3           | 3           |

**Assessment Scheme:**

Two components of Continuous Assessment (CA-1, CA-2), Mid Semester Examination (MSE) and End Semester Examination (ESE) having 20%, 30% and 50% weightage respectively.

| Assessment Component | Marks |
|----------------------|-------|
| CA1                  | 15    |
| MSE                  | 20    |
| CA2                  | 15    |
| ESE                  | 50    |

**CA1** and **CA2** are based on Assignment/ Declared test/ Quiz/Seminar/Group discussions presentation, etc.

**MSE** is based on 50% of course content.

**ESE** is based on 100% course content with 60-70% weightage for course content covered after MSE

| <b>Title of the Course:</b> RF and Millimeter Wave Circuit Design | <b>L</b> | <b>T</b> | <b>P</b> | <b>Credit</b> |
| <b>Course Code:</b> 26ETC11041                                    | <b>3</b> | <b>-</b> | <b>-</b> | <b>3</b>      |

### **Course Prerequisite:**

The following prerequisites are needed:

1. Electromagnetic Field Theory
2. Microwave Engineering
3. Analog Communication Systems
4. Network Theory and Transmission Lines
5. Signals and Systems
6. Analog Electronics and RF Fundamentals
7. Antenna and Wave Propagation
8. Basic Semiconductor Devices
9. MATLAB/HFSS/CST/ADS simulation basics

### **Course Description:**

This course introduces the design and analysis of RF and millimeter wave circuits used in modern wireless communication, radar, satellite, automotive, and 5G/6G systems. The course covers RF transmission lines, impedance matching techniques, microwave passive and active circuit design, scattering parameters, RF filters, amplifiers, oscillators, mixers, and low-noise amplifiers.

The course further explores millimeter wave propagation characteristics, planar transmission structures, MMIC concepts, RF subsystem design, and high-frequency measurement techniques. Emphasis is given to practical RF design methodologies, CAD-based simulation tools, and advanced applications in high-speed wireless systems, IoT, automotive radar, and next-generation communication systems.

Students will gain theoretical understanding and practical design knowledge required for RF and millimeter wave integrated circuit and subsystem development.

### **Course Objectives:**

1. Understand the fundamentals of RF and millimeter wave systems, transmission lines, and microwave network analysis techniques.
2. Analyze and design RF passive circuits including matching networks, filters, couplers, and resonators.
3. Study RF active circuit design including amplifiers, oscillators, mixers, and low-noise amplifiers.
4. Develop knowledge of millimeter wave propagation, MMIC technology, and high-frequency subsystem integration.
5. Apply RF CAD tools and measurement techniques for RF and millimeter wave circuit analysis and implementation.

**Course Outcomes:**

| <b>CO</b>  | <b>After the completion of the course the student should be able to</b>                                                                             |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>CO1</b> | Analyze RF transmission lines, scattering parameters, impedance matching, and microwave network characteristics for high-frequency applications.    |
| <b>CO2</b> | Design RF passive components such as filters, couplers, resonators, and matching networks for microwave communication systems.                      |
| <b>CO3</b> | Design and evaluate RF active circuits including amplifiers, oscillators, mixers, and low-noise amplifiers for wireless communication applications. |
| <b>CO4</b> | Analyze millimeter wave propagation, MMIC technologies, and RF subsystem integration techniques used in modern 5G/6G and radar systems.             |
| <b>CO5</b> | Apply RF CAD tools and high-frequency measurement techniques for simulation, analysis, and implementation of RF and millimeter wave circuits.       |

**Course pre-requisite:** Semiconductor Devices and Electronic Circuits.,Digital Electronics and Logic Design.,Analog Electronics and MOSFET characteristics

**Course Description:** This course introduces the principles and methodologies involved in the design and implementation of Very Large Scale Integration (VLSI) systems. It covers MOS transistor operation, CMOS fabrication processes, layout design rules, scaling effects, subsystem design methodologies, FPGA-based systems, memory design, timing analysis, testing, and verification techniques. The course emphasizes the design flow from device-level concepts to system-level implementation and equips students with the knowledge required for modern integrated circuit design.

**Course Objectives:**

1. Understand MOS transistor characteristics, CMOS technology, and fabrication processes used in VLSI systems.
2. Apply layout design rules and analyze delay and performance parameters in CMOS circuits.
3. Study scaling principles and design methodologies for VLSI subsystems and arithmetic circuits.
4. Analyse programmable logic devices, FPGA architectures, and digital system implementation techniques.
5. Understand memory architectures, timing considerations, testing, and verification methods used in VLSI systems.

**Course Outcomes:**

| <b>CO No.</b> | <b>Course Outcomes</b>                                                                                              |
|---------------|---------------------------------------------------------------------------------------------------------------------|
| <b>CO1</b>    | Explain MOS transistor characteristics, CMOS fabrication processes, and VLSI design flow.                           |
| <b>CO2</b>    | Apply layout design rules and analyze delay, capacitance, and performance of CMOS circuits.                         |
| <b>CO3</b>    | Design and evaluate VLSI subsystems using scaling principles and modular design methodologies.                      |
| <b>CO4</b>    | Analyze and implement digital systems using programmable logic arrays and FPGA architectures.                       |
| <b>CO5</b>    | Evaluate memory architectures, timing issues, testing, and verification techniques for reliable VLSI system design. |

| <b>Course Code:</b> 26ETC11043                          | <b>3</b> | <b>--</b> | <b>-</b> | <b>3</b>      |

**Course Pre-Requisite:** Students enrolling in Optical Fiber Communication should have prior knowledge of the Electromagnetic Field Theory, Analog and Digital Communication, Signals and Systems These prerequisites help students understand wave propagation, modal analysis, dispersion phenomena, and optical system design effectively.

**Course Description:** This course introduces the fundamentals of optical fiber communication systems including light propagation through optical fibers, modal analysis, fiber fabrication techniques, attenuation and dispersion mechanisms, nonlinear effects, and fiber-based devices. The course also covers optical amplifiers, fiber Bragg gratings, optical sensors, and photonic crystal fibers used in modern high-speed communication networks.

**Course Objectives:**

1. To understand the basic principles and importance of optical fiber communication systems.
2. To analyze light propagation mechanisms and electromagnetic wave behavior in optical fibers.
3. To study different optical fiber fabrication techniques, splicing, and connector technologies
4. To understand attenuation, dispersion, pulse propagation, and nonlinear effects in optical fibers.
5. To study the operation and applications of fiber-based devices such as optical amplifiers, fiber Bragg gratings, and optical sensors.

**Course Outcomes:**

| <b>CO</b>  | <b>After the completion of the course the student should be able to</b>                      |
|------------|----------------------------------------------------------------------------------------------|
| <b>CO1</b> | Recognize and classify the structures and types of optical fibers.                           |
| <b>CO2</b> | Demonstrate electromagnetic and mathematical analysis of light wave propagation.             |
| <b>CO3</b> | Analyze fabrication techniques of different optical fibers.                                  |
| <b>CO4</b> | Interpret dispersion compensation mechanisms, scattering effects, and modulation techniques. |
| <b>CO5</b> | Interpret the working of fiber-based devices                                                 |

### Course Prerequisite:

Based on the proposed syllabus contents, the following prerequisites are recommended for the course:

1. **Engineering Mathematics**
  - Probability and Statistics
  - Random Variables and Probability Distributions
  - Linear Algebra and Matrices
  - Vector Spaces and Eigenvalues
  - Differential Equations
2. **Signals and Systems**
  - Continuous-time and discrete-time signals
  - System properties and classifications
  - Convolution and correlation
  - Fourier Series and Fourier Transform
  - Z-Transform and Laplace Transform
3. **Digital Signal Processing**
  - Sampling and reconstruction
  - Discrete Fourier Transform (DFT) and FFT
  - Digital filter concepts
  - FIR and IIR systems
  - Spectral analysis basics
4. **Linear Algebra and Numerical Methods**
  - Matrix operations
  - Orthogonalization techniques
  - Least squares solutions
  - Eigenvalue decomposition
  - Singular Value Decomposition (SVD) basics
5. **Communication Engineering Fundamentals**
  - Random processes in communication
  - Noise in communication systems
  - Signal estimation concepts
  - Detection and filtering basics
6. **Programming and Computational Skills**
  - MATLAB/Python programming basics
  - Algorithm implementation
  - Numerical computation techniques

### Course Description:

This course introduces the fundamental principles and advanced techniques of Statistical Signal Processing with emphasis on stochastic signal analysis, signal modeling, optimum filtering, and estimation methods. The course begins with the study of random variables, stochastic processes, stationarity, ergodicity, and spectral estimation concepts required for

statistical analysis of signals.

The course further covers stochastic signal models such as autoregressive (AR), moving average (MA), and autoregressive moving average (ARMA) models along with power spectral density estimation methods. It also introduces optimum linear filtering techniques including Wiener filtering, linear prediction, inverse filtering, and deconvolution methods used for signal estimation and noise reduction.

In addition, the course focuses on algorithms and structures for optimum filters such as Levinson-Durbin recursion, Schur algorithms, lattice structures, Toeplitz matrix inversion, and Kalman filtering techniques for efficient real-time signal processing implementation. The course also covers least squares filtering and parameter estimation methods including orthogonalization techniques and singular value decomposition (SVD)-based solutions.

The subject enables students to develop analytical, mathematical, and computational skills required for modern applications in communication systems, speech processing, biomedical signal processing, radar systems, image processing, adaptive filtering, and intelligent signal analysis systems.

#### **Course Objectives:**

- To introduce the fundamental concepts of random variables, stochastic processes, stationarity, ergodicity, and spectral estimation required for statistical analysis of signals.
- To understand stochastic signal models such as AR, MA, and ARMA models along with power spectral density and spectral estimation techniques for signal characterization and analysis.
- To study optimum linear filtering, linear prediction, inverse filtering, and deconvolution techniques used for signal estimation and noise reduction.
- To understand computational algorithms and structural implementations of optimum filters including Levinson-Durbin recursion, lattice structures, Toeplitz matrix inversion, and Kalman filtering techniques.
- To learn least squares estimation and filtering methods along with orthogonalization and SVD-based techniques for solving signal estimation and adaptive filtering problems.

#### **Course Outcomes:**

| <b>CO</b>  | <b>After the completion of the course the student should be able to</b>                                                                                 |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>CO1</b> | Explain the concepts of random variables, stochastic processes, stationarity, ergodicity, and spectral estimation used in statistical signal analysis.  |
| <b>CO2</b> | Analyze stochastic signal models such as AR, MA, and ARMA models and evaluate power spectral density estimation techniques for signal characterization. |

|            |                                                                                                                                                                                               |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>CO3</b> | Apply optimum linear filtering, linear prediction, inverse filtering, and deconvolution techniques for signal estimation and noise reduction problems.                                        |
| <b>CO4</b> | Analyze the algorithms and structural implementations of optimum filters including Levinson-Durbin recursion, lattice structures, Toeplitz matrix inversion, and Kalman filtering techniques. |
| <b>CO5</b> | Evaluate least squares filtering and estimation techniques using orthogonalization and SVD-based methods for adaptive signal processing applications.                                         |

#### CO-PO Mapping:

| CO         | PO1 | PO2 | PO3 | PO4 | PO5 | PO6 | PSO1 | PSO2 |
|------------|-----|-----|-----|-----|-----|-----|------|------|
| <b>CO1</b> | 3   | 2   | -   | 1   | 1   | -   | 3    | 1    |
| <b>CO2</b> | 3   | 3   | -   | 2   | 2   | -   | 3    | 2    |
| <b>CO3</b> | 3   | 2   | -   | 3   | 2   | -   | 3    | 2    |
| <b>CO4</b> | 3   | 3   | -   | 3   | 3   | -   | 3    | 3    |
| <b>CO5</b> | 3   | 3   | 1   | 3   | 3   | -   | 3    | 3    |

#### Assessment Scheme:

Two components of Continuous Assessment (CA-1, CA-2), Mid Semester Examination (MSE) and End Semester Examination (ESE) having 20%, 30% and 50% weightage respectively.

| Assessment Component | Marks |
|----------------------|-------|
| CA1                  | 15    |
| MSE                  | 20    |
| CA2                  | 15    |
| ESE                  | 50    |

**CA1** and **CA2** are based on Assignment/ Declared test/ Quiz/Seminar/Group discussions presentation, etc.

**MSE** is based on 50% of course content.

**ESE** is based on 100% course content with 60-70% weightage for course content covered after MSE

**Course Pre-Requisite:** Engineering Mathematics III, Digital Signal Processing, Digital Image Processing

### Course Description:

This course aims to focus on practical approach on Image and Video Processing. It includes the concepts based upon Image enhancement, Image Compression, edge detection,, video processing etc.

### Course Objectives:

1. Develop practical skills in image preprocessing and enhancement techniques.
2. Apply image segmentation, edge detection, and feature extraction methods for image analysis.
3. Implement object detection and recognition techniques using computer vision tools.
4. Perform video processing, motion analysis, and object tracking operations.
5. Analyze video compression and advanced video analytics techniques using modern software tools.

### Course Outcomes:

| CO  | After the completion of the course the student should be able to                                                                                |
|-----|-------------------------------------------------------------------------------------------------------------------------------------------------|
| CO1 | Apply image sampling, quantization, intensity transformation, and image enhancement techniques using modern image processing tools.             |
| CO2 | Apply edge detection, image segmentation, and feature extraction techniques for image analysis and interpretation.                              |
| CO3 | Analyze background subtraction, moving object detection, and object recognition techniques for computer vision applications.                    |
| CO4 | Perform video frame extraction and video processing operations for representation and analysis of video data.                                   |
| CO5 | Analyze motion estimation, object tracking, and video compression techniques for advanced video processing and intelligent vision applications. |

### CO-PO Mapping:

| CO  | PO1 | PO2 | PO3 | PO4 | PO5 | PO6 | PSO1 | PSO2 |
|-----|-----|-----|-----|-----|-----|-----|------|------|
| CO1 | 3   | 1   | -   | 2   | 3   | -   | 3    | 1    |
| CO2 | 3   | 1   | -   | 3   | 3   | -   | 3    | 2    |
| CO3 | 3   | 2   | -   | 3   | 3   | -   | 3    | 2    |
| CO4 | 3   | 1   | -   | 2   | 3   | -   | 3    | 3    |
| CO5 | 3   | 2   | 1   | 3   | 3   | 1   | 3    | 3    |

**Assessment Scheme:**

Two components of Continuous Assessment (CA-1, CA-2), Mid Semester Examination (MSE) and End Semester Examination (ESE) having 20%, 30% and 50% weightage respectively.

| Assessment Component | Marks |
|----------------------|-------|
| CA1                  | 25    |
| MSE                  | --    |
| CA2                  | 25    |
| POE                  | 50    |

**CA1** and **CA2** are based on Assignment/ Declared test/ Quiz/Seminar/Group discussions presentation, etc.

**POE** is based on 100% course content with 60-70% weightage for course content covered.

**Course Contents**

### Course Objectives:

1. Introduce students to the foundational concepts, philosophies, and components of Indian knowledge systems, including ancient scriptures, philosophies, and traditional practices.
2. Introduce students to Vedic mathematical principles and computational techniques from ancient Indian texts, demonstrating their practical use in engineering calculations.
3. Explore the potential benefits of incorporating yogic and meditative practices into engineering to enhance focus, creativity, and overall well-being.
4. Study architectural concepts from Indian traditions and evaluate how they can inform modern urban planning and sustainable architecture.
5. Encourage students to draw inspiration from IKS to develop innovative engineering solutions that align with ancient wisdom while meeting contemporary needs.

### Course Outcomes:

| CO  | After the completion of the course the student should be able to                                                                                             |
|-----|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CO1 | Gain a comprehensive understanding of the philosophical, scientific, and technological aspects of Indian Knowledge Systems and their historical development. |
| CO2 | Understand the philosophical underpinnings of IKS, including concepts like dharma, karma, and holistic thinking, and explore their relevance to engineering. |
| CO3 | Understand Vedic mathematical principles and computational methods, and their potential relevance in solving modern engineering problems.                    |
| CO4 | Investigate the connections between yoga, meditation, and stress management, and their potential impact on mental well-being in engineering contexts.        |

| <b>Title of the Course:</b> YOGA for Stress Management | <b>L</b> | <b>T</b> | <b>P</b> | <b>Credit</b> |
| <b>Course Code:</b> 26ETC1108                          | --       | --       | 2        | 1             |

### Course pre-requisite:

Basic awareness of health, stress, and well-being, along with a willingness to practice yoga techniques and lifestyle modifications, is desirable.

**Course Description:** This course introduces the concepts of stress and its management through modern scientific and traditional yogic perspectives. It covers the causes and effects of stress, stress physiology, sleep, diet, and assessment methods, along with the role of yoga in preventing and managing stress-related disorders. The course also includes practical training in yoga postures (Asanas), breathing techniques (Pranayama), meditation, relaxation techniques, and integrated yoga modules to promote physical, mental, and emotional well-being

### Course Objectives:

1. Understand the physiological and psychological aspects of stress and its impact on overall well-being.
2. Learn and practice specific yoga postures, breathing exercises, and relaxation techniques to alleviate stress.
3. Explore the connection between mindfulness, meditation, and stress reduction, fostering mental clarity.
4. Discover holistic practices that promote better sleep, nutrition, and overall lifestyle habits for stress management.
5. Develop practical skills to manage stress in daily life, enhancing resilience and promoting emotional balance.

### Course Outcomes:

| CO  | After the completion of the course the student should be able to                                                             |
|-----|------------------------------------------------------------------------------------------------------------------------------|
| CO1 | Recognize the signs and sources of stress, understanding its effects on mental and physical well-being.                      |
| CO2 | Master a variety of yoga techniques, including postures, breathing, and meditation, to effectively manage stress.            |
| CO3 | Acquire relaxation strategies that promote calmness, reduce anxiety, and enhance overall mental clarity.                     |
| CO4 | Incorporate healthy habits inspired by yoga principles to foster better sleep, nutrition, and self-care routines.            |
| CO5 | Develop practical skills to navigate and cope with stress, enhancing emotional balance and promoting a more harmonious life. |

**CO-PO Mapping:**
